Prime Fibonacci Number Sets that Correlate with Ancient Site Distances

The following is a list of Fibonacci numbers that show an intriguing relationship with prime numbers (highlighted in **blue**) in that *both their values and their placement in the Fibonacci sequence are prime*. With F#**31** we find the first instance where the placement is prime (**31**) but the value is not, as in the case of F#**37**, F#**41**, F#**53** and others. Three consecutive primes, F#**131**, F#**137** and F#359 are the basis for the nine-number Fibonacci segments that describe the ancient site distances from Giza in percent and miles. Resonant distances from Giza to other sacred sites can be described as a percent of Earth's circumference by F#**131-139**. These alignments are also accurately described in miles by F#**353-361**. The proportions of the global site distances are reflected in each Fibonacci number sequence, with dozens of major megalithic site alignments accurately reflecting Fibonacci ordered geositions.
